VIOLENCE AGAINST WOMEN & GIRLS

Survey attitudes analysis | SDG 5 — Gender Equality | Based on the supplied Dash application and CSV dataset

55,935	70	2000–2018	19.8%
Valid survey records	Countries represented	Survey years	Overall mean

Executive summary

The supplied file contains **63,000 rows**. After applying the data preparation rules in app.py and excluding records without a valid numeric Value or survey year, **55,935 records** remain for analysis (7,065 rows have a missing Value). The valid records cover **70 countries**, **18 distinct survey years** from 2000 to 2018, and 6 survey statements. The overall unweighted mean agreement is **19.8%** (median 14.9%).

Among the six statements, **“At least one reason”** has the highest mean agreement (33.2%), while **“Burns the food”** has the lowest (9.2%). Country-level averages are descriptive summaries of the available records: Timor-Leste has the highest unweighted country mean (46.2%), and Dominican Republic the lowest (1.6%).

Female-labelled records have a mean Value of 22.9% (n=30,715); male-labelled records have a mean of 15.9% (n=25,220). These differences describe the supplied survey records and should not be interpreted as causal effects or population-level comparisons without the relevant survey design and weighting information.

Important interpretation

Value is an agreement percentage for a survey statement. It is not a count or rate of incidents, and it does not measure the actual incidence or prevalence of violence. The statements concern respondents’ attitudes about circumstances in which a husband may be considered justified in hitting or beating his wife. The report therefore describes attitudes in the supplied survey data, not violence events.

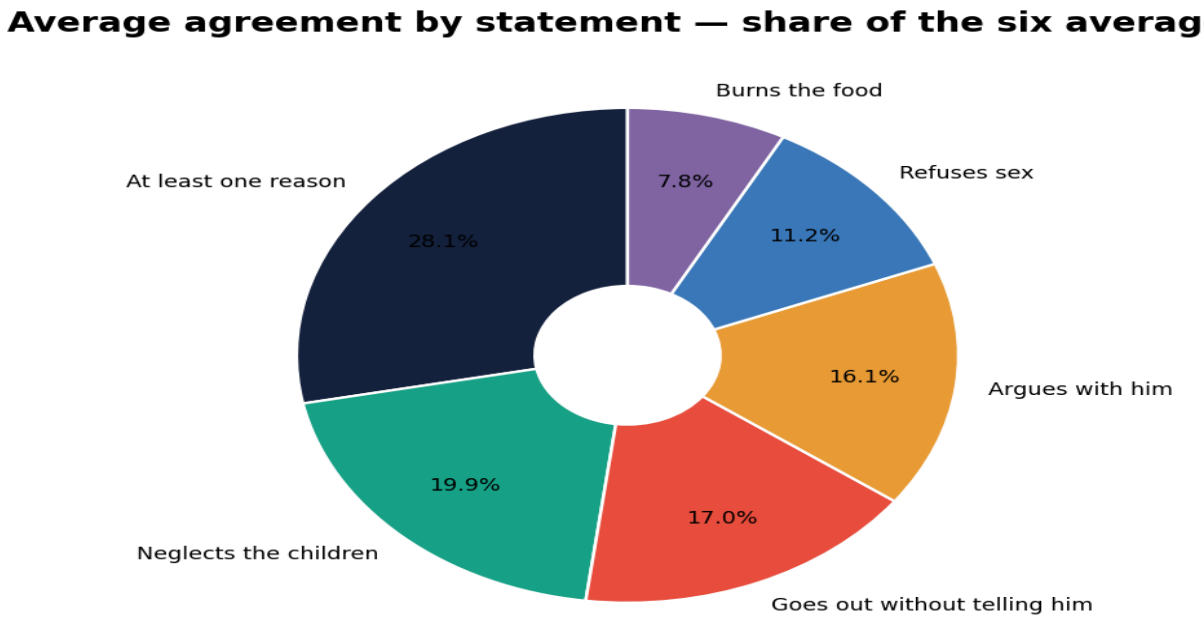

All averages in this report are unweighted because respondent counts/weights are not included in the supplied dataset. The analysis does not claim that countries are directly comparable in representativeness, survey timing, sample design or population coverage.

Dataset profile

Dataset item	Result
Rows in supplied CSV	63,000

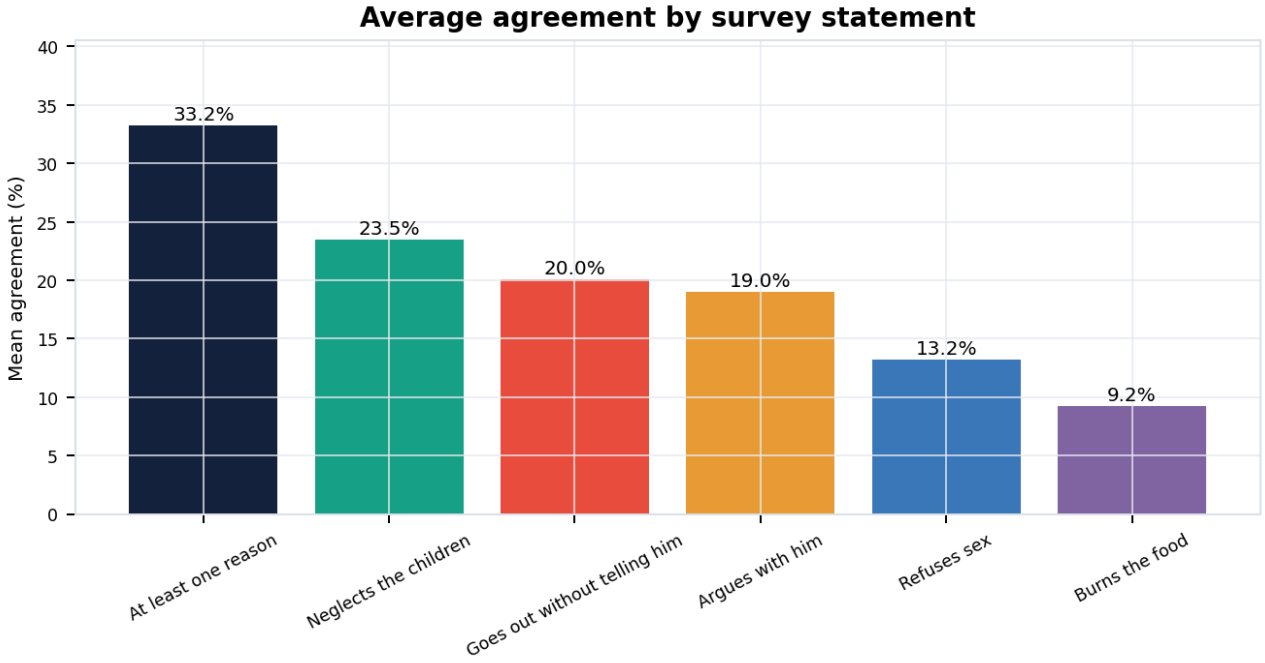

Rows used after cleaning	55,935
Rows excluded for missing/invalid Value or year	7,065
Countries / survey years / statements	70 / 18 / 6
Value range / median / mean	0.0%–86.9% / 14.9% / 19.8%

01. Pie chart — relative share of statement averages

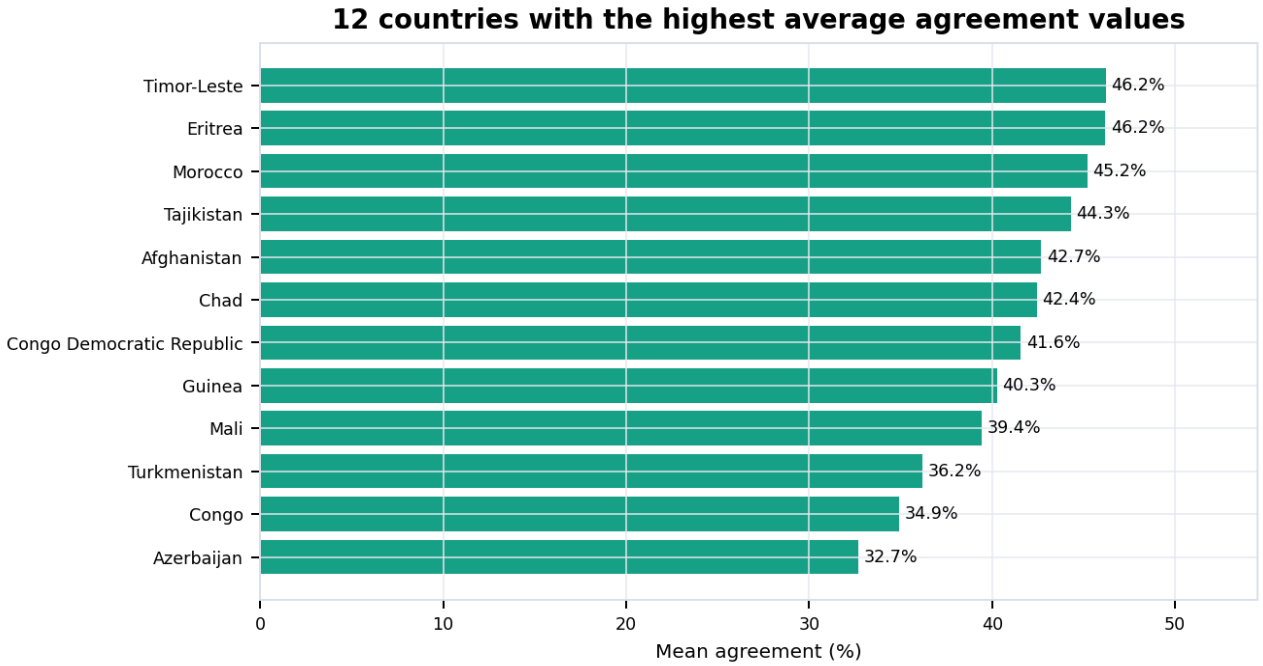

Each slice represents one statement's mean Value as a share of the sum of all six statement means. The slice percentages are not percentages of respondents and are not a prevalence measure.

02. Vertical bar — mean agreement by statement

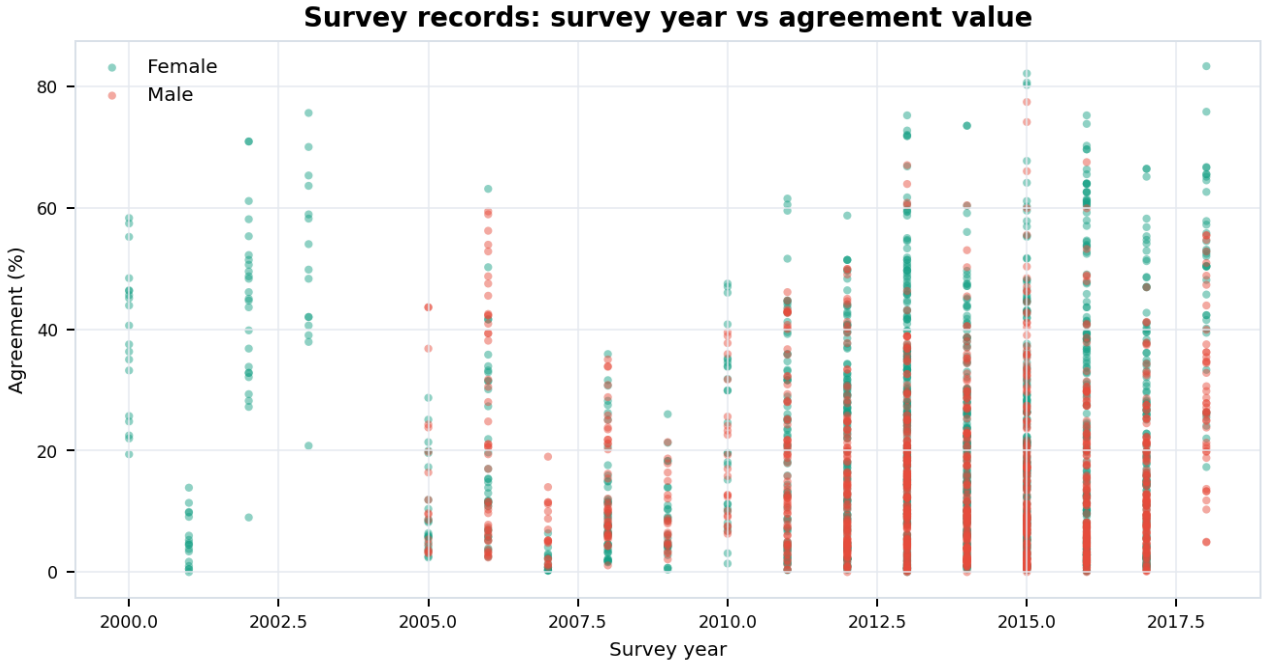

The bars compare the unweighted mean Value for each statement. “At least one reason” is highest (33.2%), and “Burns the food” is lowest (9.2%).

03. Horizontal bar — 12 highest country averages

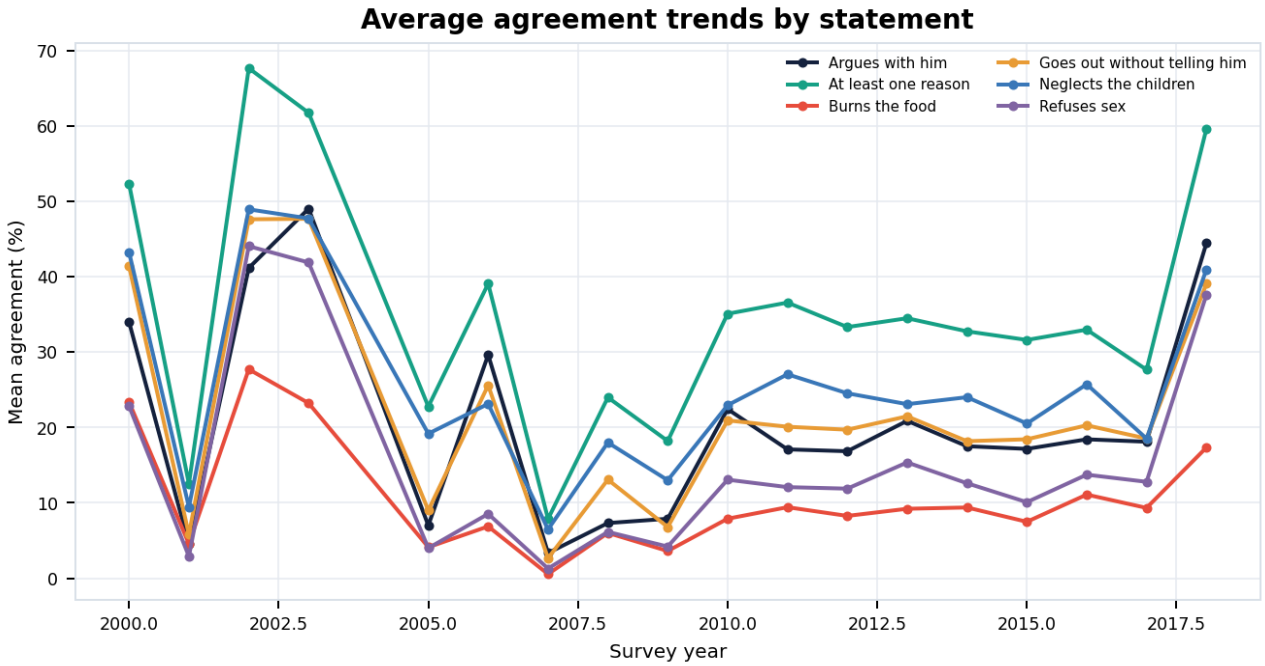

The chart ranks up to 12 countries by their unweighted mean Value in this dataset. It is not a ranking of actual violence rates. Countries may differ in survey years, composition and available records.

04. Scatter — record values by survey year

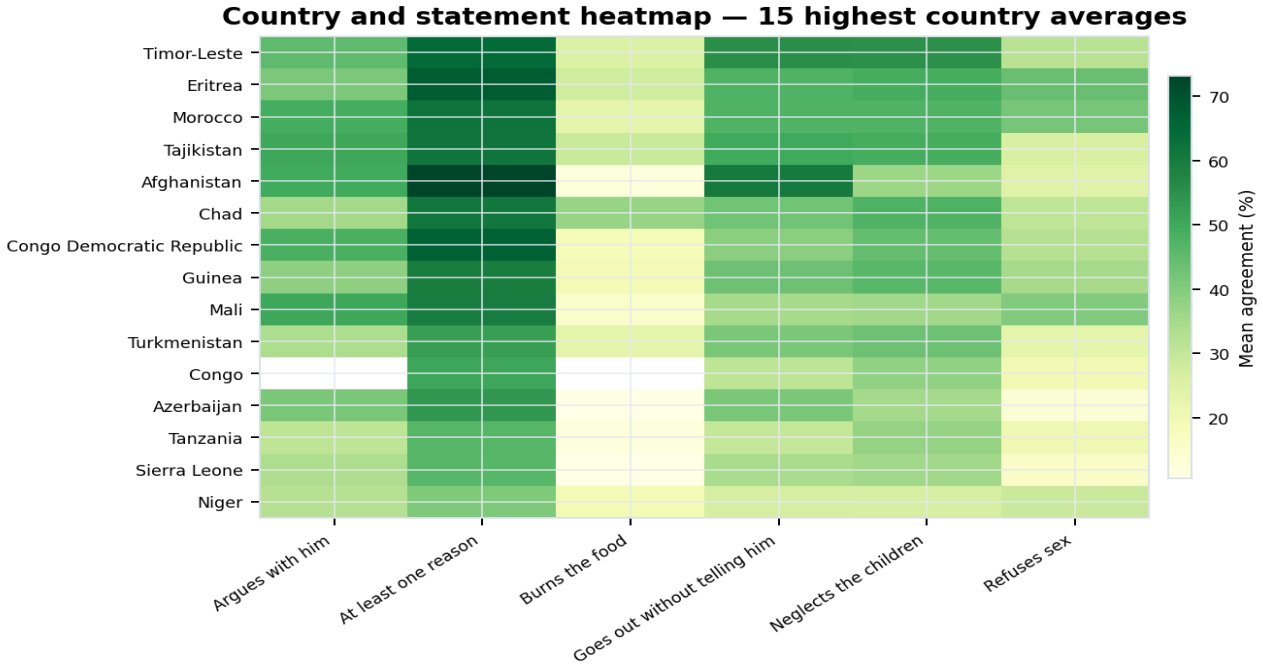

Each plotted point represents one valid survey record. The app's sampling rule is reproduced: 2,500 points shown (maximum 2,500; fixed random seed when sampled). Colours distinguish gender.

05. Line chart — yearly average by statement

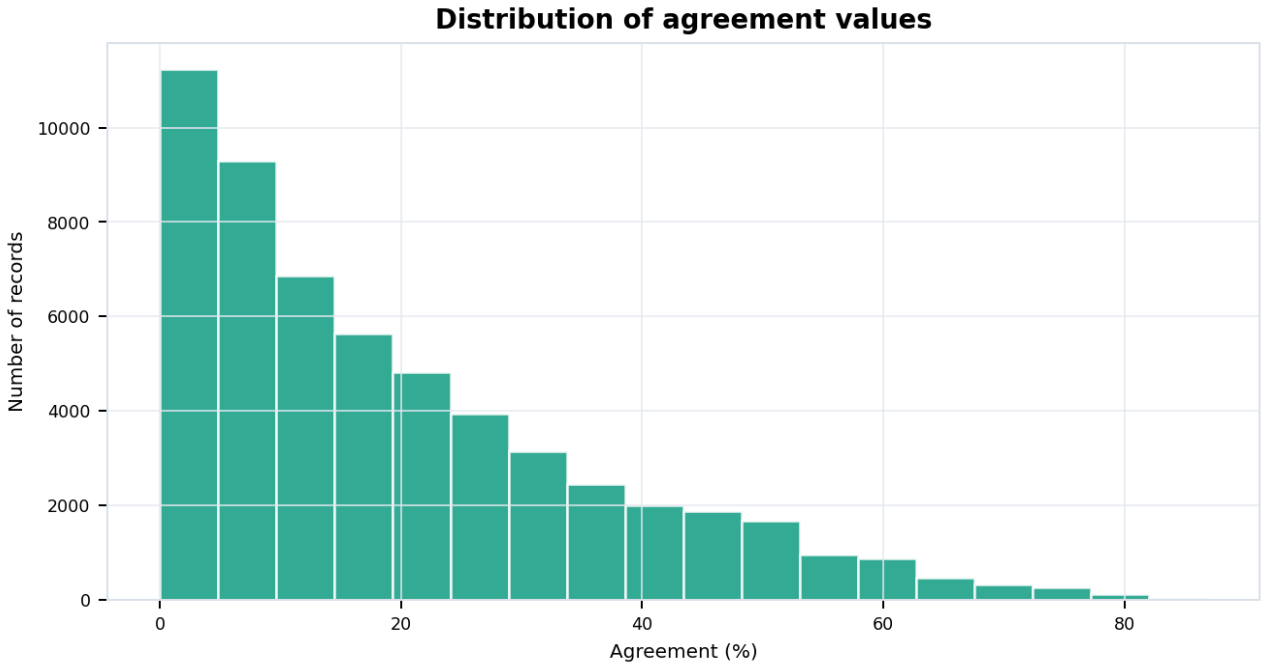

Each line tracks the unweighted yearly mean for one statement. Apparent rises or falls may reflect changes in country coverage, respondent composition, survey methods or available records, not necessarily a change in the underlying population attitude.

06. Heatmap — country by statement

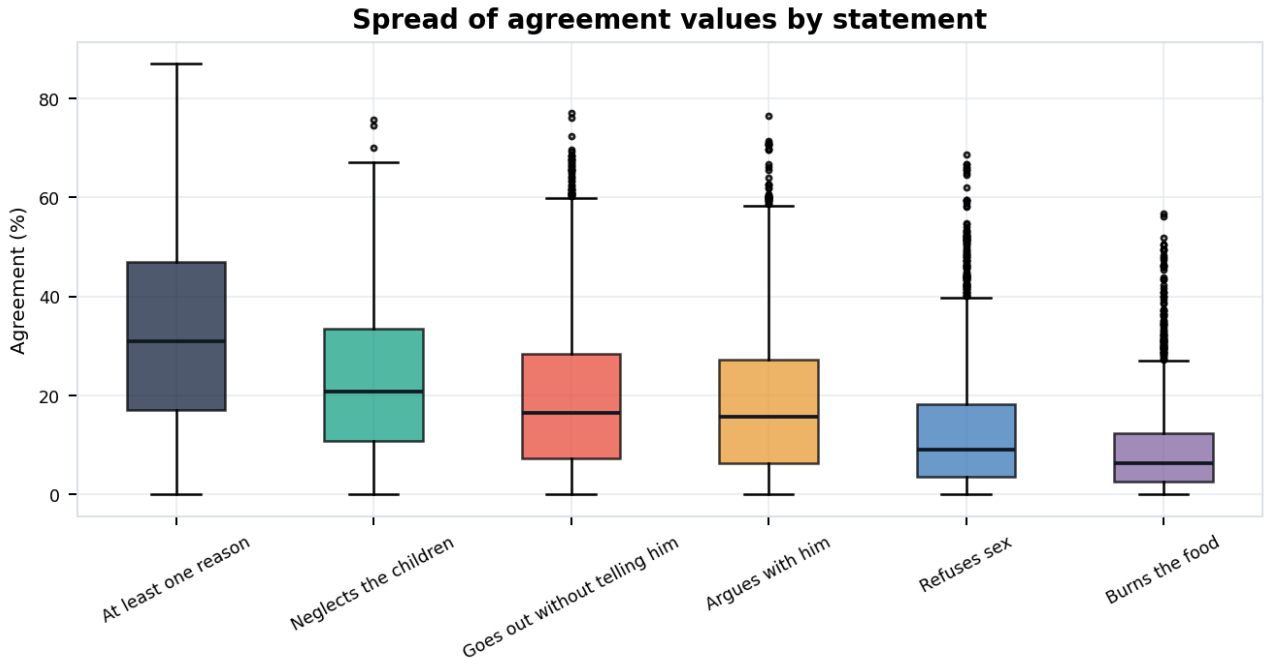

Each cell is the mean Value for one country and one statement. The chart shows the 15 countries with the highest overall country means in the valid dataset. Missing cells mean no matching record was available.

07. Histogram — distribution of agreement values

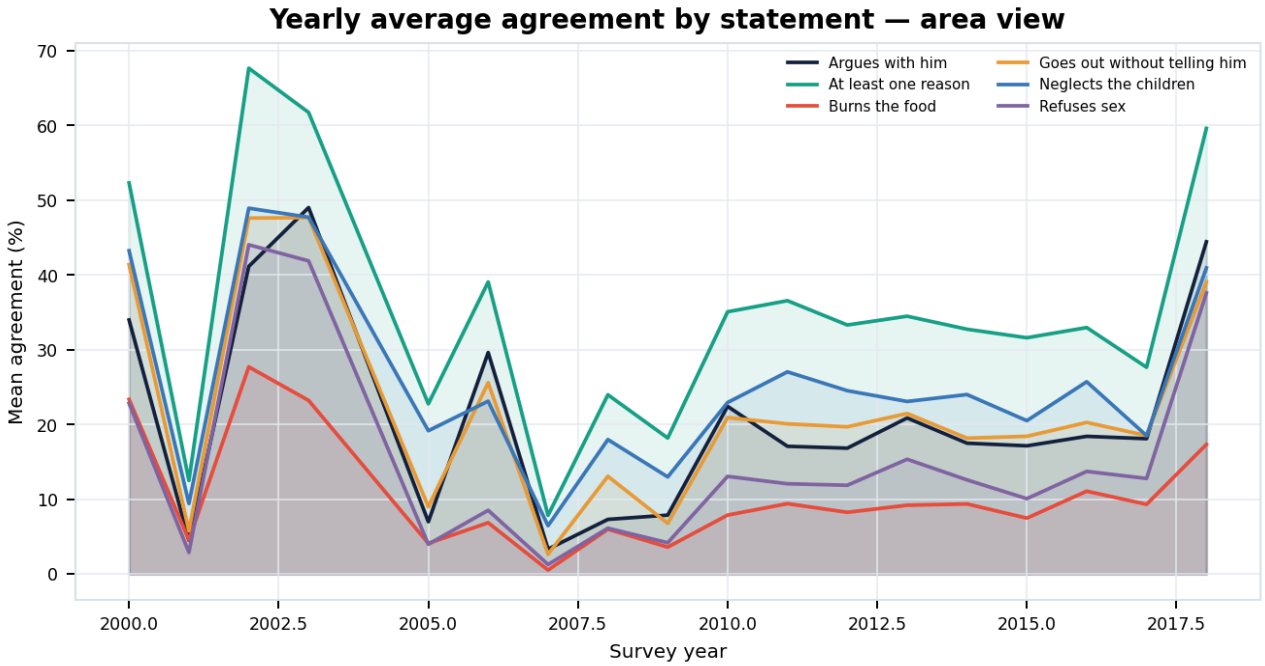

The columns count valid records within Value intervals. The distribution summarises the record-level values and should not be read as a distribution of violence incidents.

08. Boxplot — spread by statement

Boxes summarise medians and interquartile ranges; whiskers and points show spread and potential outliers. Differences in spread describe the supplied records for each statement.

09. Area chart — yearly average agreement

This is an area-style presentation of the same yearly statement means used in the line chart. Filled regions are visual emphasis only; they are not additive totals.

Findings and interpretation

Statement-level results

Survey statement	Mean agreement	Relative position
At least one reason	33.2%	1 of 6
Neglects the children	23.5%	2 of 6
Goes out without telling him	20.0%	3 of 6
Argues with him	19.0%	4 of 6
Refuses sex	13.2%	5 of 6
Burns the food	9.2%	6 of 6

Country-level summary

Country (highest means)	Mean Value	Country (lowest means)	Mean Value
Timor-Leste	46.2%	Dominican Republic	1.6%
Eritrea	46.2%	Peru	1.8%
Morocco	45.2%	Colombia	2.4%
Tajikistan	44.3%	South Africa	3.6%
Afghanistan	42.7%	Ukraine	3.7%
Chad	42.4%	Guatemala	4.2%
Congo Democratic Republic	41.6%	Philippines	5.1%
Guinea	40.3%	Albania	5.4%

Gender summary

Gender	Valid records	Mean agreement
Female	30,715	22.9%

Gender	Valid records	Mean agreement
Male	25,220	15.9%

Methodology and limitations

Source files: the supplied app.py and violence_data(4).csv. The report reproduces the app's data-cleaning and chart logic, using all filters set to "All".

Data preparation: Value is converted to numeric; Survey Year is converted to a numeric year or parsed from a date; F/M are labelled Female/Male; the six known survey question strings are given shorter display labels. Rows missing Value or Survey Year are excluded.

Aggregation: means are arithmetic, unweighted averages. The file does not provide respondent counts or survey weights suitable for weighted estimates. The row count is the number of records, not necessarily the number of unique respondents.

Comparability: country and year averages can be influenced by the mix of demographic groups, statement coverage, survey years and record counts. The available CSV does not establish that all records are independent or nationally representative.

Interpretation: Values describe agreement with survey statements. They must not be described as actual violence incidence, prevalence, victimisation counts or risk rates.

Graph notes: the pie chart expresses each statement mean as a share of the sum of statement means; the horizontal bar chart displays the 12 highest country averages; the heatmap displays the 15 highest country averages; the scatter plot is capped at 2,500 records with random_state=42.
